Abstract (en)

[origin: WO2019132753A1] A method and control unit for configuring an add-on interface of a vehicle are presented. The of a vehicle includes at least one vehicle internal system, at least one add-on system, the add-on system being arranged in the vehicle after the vehicle is produced by a manufacturer, and at least one internal communication unit arranged for communication with at least one vehicle external communication unit. The method includes: - receiving, by usage of the at least one internal communication unit, configuration information related to at least one signal Savaiiable from an add-on system and/or from the add-on interface being available for an add-on interface, at least one representation to be used for at least one output signal Soutput, and at least one output port, on which the at least one output signal Soutput is to be provided. The add-on interface is configured, based on the configuration information, to provide, on the at least one output port, the at least one output signal Soutput having at least one characteristic related to the representation, such that the at least one output signal Soutput is detectable and/or usable by one or more of the at least one add-on system and the at least one vehicle internal system.
