Abstract (en)  
A transportable device (1) for the safekeeping of objects comprises: a transportable container (10), including a containing shell (101) which affords an internal space (101') and a closing shell (102) which is movable relative to the containing shell (101) between an open position (PA) and a closed position (PC); a locking unit (12) connected to the container (10) and movable between an unlocked position (PS) and a locked position (PB); an actuator (13), configured to receive drive signals (131) and connected to the locking unit (12) to move it between the locked position (PB) and the unlocked position (PS); a control unit (14) configured to receive access data (141) and to generate the drive signals (131); a grippable handle (11) connected to the container (10) and configured to be connected to an external restraining object. The control unit (14) is configured to receive an enabling signal (142) and, as a function of the enabling signal (142), to enable the generation of the drive signals (131) in response to the access data (141).
