Abstract (en)
Embodiments of this application provide a relay transmission method, where a first node is a parent node of the second node. The method includes: receiving, by the second node, a request message from the first node, where the request message is used to request the second node to become a parent node of the first node; and sending, by the second node, indication information to the first node, where the indication information is used to indicate that a downlink beam sent from the second node to the first node after the second node becomes the parent node is the same as or similar to an uplink beam sent from the second node to the first node when the first node is the parent node. The indication information may be carried in a response message for the request message. The first node may learn of, through the indication information, information about a transmit beam used by the second node after switching. Therefore, an additional beam search or beam training is not required in a switching process.
