Abstract (en)
[origin: EP3735063A1] To prevent deterioration in communication throughput and so on also in a case that multiplexing of uplink control information on an uplink data channel is supported, one aspect of a base station according to the present disclosure includes a transmitting section that transmits downlink control information indicating UL transmission, and DL data, and a control section that controls scheduling such that the number of bits of a acknowledgement signal for the DL data, the acknowledgement signal being to be multiplexed on a first uplink shared channel that is transmitted based on the downlink control information and/or a second uplink shared channel that is transmitted independently of the downlink control information, is up to a given value.
