Abstract (en)

[origin: WO2019139471A1] The invention relates to a device for engaging a fastening element such as a screw or a bolt, which device comprises: - a body; - a number of pins, each with a first and a second outer end, which pins extend, alongside each other and parallel to a rotation axis running between the pins, to the second free outer ends and which pins are arranged with the first outer ends on the body wherein a protrusion is attached close to and preferably at the second outer end of at least a first pin of the pins, which protrusion extends from the first pin in tangential direction relative to the rotation axis. The invention further relates to a combination of the device and a fastening element such as a screw or bolt, and to a fastening element such as a screw or bolt.
