Abstract (en)

[origin: WO2019136506A1] The invention relates to a container (1) having an opening (9) and an opening section (10), which extends in a cylinder shape, proceeding from the opening (9), which container comprises a sealing cap (3) that is removably fixed to the container (1) and seals the opening (9) when in a closed position and has a substantially cylindrical shell surface (30), which encloses the opening section (10) at least in part when in the closed position. Interacting latching elements (17, 34) are provided on an inner surface of the shell surface (30) of the sealing cap (3) and on an outer surface of the opening section (10). A peripheral protrusion (13) is provided below the latching elements (17, 34) in the opening section (10). A ring (5) is peripherally connected on the top edge (50) thereof to the shell surface (30) of the sealing cap via a tear-off skin (7). The tear-off skin (7) contacts the first protrusion (13) of the originally sealed container.
