Abstract (en)

[origin: WO2019137887A1] The finishing accessory (1A) comprises a deformable finishing profile section (10) and at least one immobilising part (P2A). Said finishing profile section (10) is suitable for forming a finishing connection between two surfaces (S1; S2), and comprises two rigid wings (100; 101) which extend in length parallel to a longitudinal axis (A), which are spaced apart from each other and which are intended to be in contact respectively with the two surfaces (S1; S2) to be connected, and a flexible hinge (102) which extends in length parallel to said longitudinal axis (A), which is, at least partially, positioned between the two wings (100; 101), and which connects the two wings together while allowing a rotation of the two wings (100; 101) with respect to each other in a plane (X,Y) perpendicular to the longitudinal axis (A). Said immobilising part (P2A) comprises an adjustment wedge (20a), which extends in length and which once inserted in a longitudinal groove (103) of the finishing profile section, makes it possible to immobilise the inward rotation of the two wings (100; 101) with respect to each other in a plane (X, Y) perpendicular to the longitudinal axis (A) and in the first directions of rotation (R1a; R1b) of the inner faces (100b; 101b) of the wings (100; 101) with respect to each other, with a predefined angular orientation of the two wings (100; 101) with respect to each other.
