Abstract (en)

Central fastening element for a roller awning with articulated arms, relating to an element the purpose of which is to provide fastening means in the central part of roller awnings with articulated arms serving as a support for the rolling shaft of the awning and for absorbing the reduction and/or increase in diameter thereof when said awning is let out and taken up. This element has a structural configuration which expands the regulation possibilities depending on the position of the awning and facilitates operations to effect said regulation.
