Abstract (en)
[origin: WO2019143252A1] The invention describes an electrical door strike (1) having a locking mechanism (4) operating under pressure, comprising a door strike house (2), a movable strike keeper (3), a barrel (8) in the door strike house, a first movable member (10), shaped like a ball, a second rotatable member (11) positioned so as to cut off the central axis of the barrel, and with a rotational axis (16) substantially orthogonal to and crossing the central axis (13) of the barrel and a rotation mechanism for rotating the second member. The second moveable member has radial extent that varies with angular position. Thus the rotation of the second rotatable member (11) causes the first moveable member (10) to be able to move in the barrel between a locked and unlocked position with less influence from pressure on the door.
