Abstract (en)
[origin: WO2019143846A1] A system and method of providing food-related information is provided. The method includes receiving a user-generated food-related query and generating, in response to the query, a subject identifier indicative of a food-related subject of the query. The method further includes accessing at least one computer database with a plurality of tables. Each table has a top-level record corresponding to the subject of the table and a plurality of lower-level records that correspond to members of the subject of the table. Each lower-level record of the plurality of lower-level records comprises a first identifier indicative of the lower-level record, at least one second identifier corresponding to the first identifier of another record in the table, and a third identifier corresponding to the top-level record of the table. The method further includes transmitting to the user multiple tables that include a primary table with lower-level records having third identifiers that correspond to the subject identifier.
