Abstract (en)

A system is provided for managing a smoking substitute device. The system includes a smoking substitute device and a first mobile device on which an application is installed, wherein the smoking substitute device has a bonded communication link with the first mobile device, via which the smoking substitute device is wirelessly accessible by the application installed on the first mobile device. The application is configured to selectively control communication between the smoking substitute device and a second mobile device that does not have a bonded communication link with the smoking substitute device. The smoking substitute device is configured to prevent a communication link with the second mobile device from being established unless permitted by the application installed on the first mobile device.
