Abstract (en)  
[origin: TW202001025A] In order to set the carriage width on an embroidery machine, a connecting rod (15) on an actuating shaft (9) running along the embroidery machine in the rear carriage (2) and having eccentric drums (11) located thereon can be driven, which connecting rod acts directly on the shuttle carriage (3) and pushes the latter back and forth in the Z-direction. By turning the actuating shaft (9) by half a revolution, the carriage width can be moved from the greatest to the minimum distance with respect to the shuttle race (5), and the shuttle race (5) can then be adjusted within tenths of millimetres through a rotational movement by a few angular degrees  $[\alpha]$ - $[\beta]$ .
