Abstract (en)  
[origin: WO2019158612A2] The invention relates to a device (50) and a method, having at least two components (32-34) that can be moved relative to each other, wherein a drive device (70) is provided with a drive housing (71) and a drive shaft (72) in order to bring about a relative movement of a first component (32) to a second component (33). If the drive shaft (72) is coupled in a rotationally fixed manner to the second component (33), the drive housing (71) is rotatably accommodated on one of the two components (32, 33) and can be coupled by means of an actuator (80) in a rotationally fixed manner to the first component (32) and can be decoupled therefrom. If the drive housing (71) is coupled in a rotationally fixed manner to the second component (33), the drive shaft (71) can be coupled by means of an actuator (80) in a rotationally fixed manner to the first component (32) and can be decoupled therefrom.
