Abstract (en)
[origin: WO2019158207A1] An apparatus comprising at least one processor and at least one memory including computer code for one or more programs. The at least one memory and the computer code configured, with the at least one processor, to cause the apparatus at least to determine at least one dynamic transmission parameter, provide an individual transmitter antenna configuration selection within a multiple-input multiple-output antenna array based on the at least one dynamic transmission parameter and implement the individual antenna configuration selection within a multiple-input multiple-output antenna array by control of at least one power amplifier and/or at least one power divider located before each antenna element.
