Abstract (en)
The present invention relates to a smart device installed in containers or similar elements disposed for the storage of waste, enabling the identification of the user who deposits therein the waste, likewise the detection of the activity of managing the waste performed, both in the management of the waste inserted and the highlighting of the user's action and the better configuration of the structure of global selective waste collection, employing for this purpose a device which is attached to the containers, be they existing or of a new design, with a system for the reading of codes/charts for the identification of the waste inserted, usually packaging waste, and employing vibration-absorbing means to minimise the effect of impacts and vibrations caused during the process of emptying the container.
