Abstract (en)

[origin: WO2019212182A1] Embodiments herein disclose an apparatus and methods for managing a shareable resource(s) in a multi-core processor. Embodiments herein relate to computer systems and, more specifically, to parallelizing a data stream for distributed processing within a computer system. The method includes providing a lockless access of the shareable resource in a multiprocessing cores or single processing core, by releasing the assigned shareable resource in a dedicated release sub queue of the each processing core, to support cross core de-allocation of the shareable resources. The method includes monitoring an occupancy level of each memory pool and dynamically adjusting the allocation per-pool without locking the shareable resources.
