Abstract (en)
[origin: EP3756525A1] Bucket (1) with wringer (2) for a mop, comprising three moving elements; two mutually facing elements (4) in a transversal plane of the bucket and displaced towards the front part of the bucket, with respect to the transversal plane (5) containing the centre of gravity of the bucket; and a third element (6) arranged in front of the transversal plane; with the wringer (2) being located in the rear part of the mouth of the bucket. Said bucket is characterised in that the rear part of the base (3) comprises at least one relief (7) which, together with said two elements (4), touch the floor when the bucket is at rest and when applying pressure to the wringer (2) with the mop; in which position the third moving element (6) is close to and separated from the floor, without touching same. The third element (6) touches the floor when pressure is applied to the front part of the bucket (1) to move same, thereby enhancing the movement and stability of the bucket.
