Abstract (en)  
[origin: EP3757034A1] The invention relates to a cardboard bottle carrier that allows bottles to be retained in a simple manner, such that the position of the bottles is secured during transport. The carrier is formed from a quadrangular cardboard sheet, symmetrically with respect to a transverse axis, forming two symmetrical parts that each comprise: a first face in which is made a first hole having a diameter similar to that of the neck of the bottle, followed by and connected to a second hole having a diameter larger than that of the mouth of the bottle, such that the neck can pass from the second hole to the first hole; a first transverse fold line; a second transverse fold line; a second face with a third hole and a fourth hole that are similar to the first two holes; a third fold line; and a third face, up to the transverse axis that forms a fourth fold line.
