Abstract (en)
[origin: EP3757322A1] Adjustable hidden hinge for doors/windows/shutters comprising a first hinge body (2), a second hinge body (6), and articulation means (10) which rotatably connect the first hinge body (2) and the second hinge body (6) around a rotation axis (X). The first hinge body (2) comprises a first hull (11), two adjustment sliding blocks (27) adjustably mounted on the first hull (11) along a first adjustment direction (H) parallel to the rotation axis (X), and a first adjustment carriage (12) adjustably mounted on the first hull (11) along a second adjustment direction (Y) orthogonal to the rotation axis (X). The first hinge body (2) also comprises two eccentric adjustment bodies (15), each comprises a first portion (28), which is inserted in a first engagement seat (16) of the first adjustment sliding block (27), and a second portion (21), which is placed in eccentric position with respect to the first portion (28), inserted in a second engagement seat (18) of the first adjustment carriage (12) and is actuatable in order to rotate the eccentric adjustment body (15) such that its second portion (21) acts abuttingly on the first adjustment carriage (12) in order to move it along the second adjustment direction (Y).
