Abstract (en)

A tank for a heat exchanger, in particular for a motor vehicle, comprising: a distribution body for delivering a coolant fluid into the heat exchanger; a first opening disposed along the longitudinal direction of the distribution body, the first opening having a substantially rectangular shape for receiving a header with tubes; a second opening disposed on the surface of the distribution body, the second opening having a circular shape; the second opening configured to receive a connector; at least one guiding means disposed in the vicinity of the second opening; the heat exchanger characterized in that the guiding means come into contact with the connector after rotating the connector in a plane delimited by the second opening, so that the guiding means prevent the connector from moving in the axis of the opening.
