Abstract (en)  
[origin: WO2019166569A1] The present invention concerns a locking system for an opening panel (1), the opening of which can be controlled manually, comprising a locking member (2) with a fastening element, arranged so as to be able to move in relation with a first axis (A1) and at least one control member (3) having an elongate structure and arranged so as to be able to pivot about at least one second axis (A2). A locking system characterised in that the locking member (2) is able to pivot about the first axis (A1), in that it is provided with two control members (3), in the form of tilting blades, kinematically independent of each other, in that each of the two control members (3) comprises its own movement transmission element, that is situated between the manoeuvring end (6) of same and the hinged end of same and that is capable of and intended to cooperate with a corresponding associated drive element of the locking member (2), and in that said locking member (2) and the two control members (3) are pivotally hinged with the opening panel (1).
