Abstract (en)

The invention relates to a passenger conveyor (10) comprising at least one linear electric motor formed by linear stator rails (26a,b, 28a,b) with stator poles (52; 74, 78) being located in a fixed correlation to an environment, and at least one mover (22, 24) co-acting and moving along the stator rails (26a,b, 28a,b). The stator rails comprise at least a first stator rail (28a,b) extending in a first movement path in a first direction of the passenger conveyor (10) and at least a second stator rail (28a,b) extending in a second movement path in a second direction of the passenger conveyor (10). The first direction and the second direction are different directions, selected from the group of horizontal, inclined and vertical directions, characterized that at least one physical property of the first stator rail (26a,b) differs from that of the second stator rail (28a,b).
