Abstract (en)

[origin: WO2019171065A1] An apparatus is disclosed for automatically aligning an infra-red sensor (2) with a hot extruded body. The apparatus includes a scanner (16) such as a motor that can point the infra-red sensor that the axis of the infra-red sensor is pointed in a plurality of directions. A central control unit (14), which is a processor, is configured to analyse the amount of infra-red radiation received in the plurality of positions, to identify a first position in which the axis of the infra-red sensor points at a first extruded body by measuring the amount of radiation received in the first position and in a plurality of positions around the first position, and to instruct the scanner to move the infra-red sensor to the first position so that the temperature of the first extruded body can be measured.
