Abstract (en)  
Invention is related to an electrical connection (1) device comprising- a barrel (10) comprising a first end (11) on which a cap (20) is mounted,- a hollow piston (40) comprising an open end (41)and a blind end (42), the hollow piston (40) being slidably mounted in the barrel (10) so that the blind end (42) extends beyond a second end of the barrel (10)- and a helical spring (60)characterized in that the electrical connection device comprises a spring clip (50) mounted between the barrel (10) and the hollow piston (40) so as to provide electrical continuity between the barrel (10) and the hollow piston (40), the first end (61) of the helical spring (60) being housed in the hollow piston (40) and a second end (62) of the helical spring (60) bearing on the cap (20) so that the maximum insertion position of the hollow piston (40) into the barrel (40) is obtained when the open end (41) of the hollow piston (40) comes into contact with the cap (20).
