Abstract (en)  
[origin: CA3086682A1] In order to improve safety, particularly during transportation and/or storage, a system (10) is proposed which at least comprises a housing (13) an explosive (3) held therein which is initiated by a blasting cap (1), wherein a sleeve insert (2, 2') in the housing (13) makes it possible for the blasting cap (1) to be removed from the explosive (3), in that the blasting cap (1) in the sleeve insert (2, 2') is height-adjustable, so that the position of the blasting cap (1) relative to the explosive (3) can be changed. The system (10) may include a fuse head (11) which at least comprises a primer cap and possibly a delay line (14). The blasting cap (1) may be an integral part of the fuse head (11) and insulated therewith on the base. The sleeve insert (2, 2') has a hollow or empty space (5) in which a separating medium or separating means (4), e.g. air, is introduced. A pressure element (15) is attached between the fuse head (11) and the housing (13) which is responsible for ensuring the separation of the blasting cap (1) and possibly the delay element (14) from the explosive (3) when under the influence of heat caused by fire, for example.
