Abstract (en)
[origin: WO2019179990A1] The invention relates to a plug connection having a plug connector (1) and a mating plug connector which are plugged together and thus produce a primary lock. A secondary lock is then produced by means of a locking device (8). The secondary lock can be produced only after the primary lock has been produced and if the two plug connectors have been plugged together previously as intended such that an automatic final lock of the plug connection is produced after the locking device (8) is actuated. The final lock is only possible if the final position of the primary lock, and thus the system lock, has been reached beforehand.
