Abstract (en)

A lighting device (1) comprises a plurality of LED light sources (2) each provided with a collimating member (3) having a main direction of light propagation (33), and an at least partially transparent optical arrangement (4, 6) positioned adjacent to the collimating members (3) such that light generated by the LED light sources (2) and propagated by the collimating members (3) into the main direction of light propagation (33) passes through the optical arrangement (4, 6). The optical arrangement (4, 6) has a microstructure (41) with a plurality of refractive cells (43) configured to shape the light passing through the optical arrangement (4, 6). Each of the plurality of refractive cells has a shoulder angle relative to the main direction of light propagation and the plurality of refractive cells (43) has refractive cells (43) with differing shoulder angles.
