Abstract (en)

[origin: WO2021023422A1] The invention relates to a screw device (10) for applying a torque to a screw partner (20), comprising flat output means (1) which have an output (1b) that can be detachably connected to the screw partner (20) and a drive (1a), to which a drive torque can be manually or mechanically applied, particularly by means of an interposed angular and/or bevel gear (31), and detection means (5) for providing measurement values for determining and/or monitoring an output torque acting on the screw partner on the output side, wherein the detection means (5) provided in a housing (30) of the flat output means (1) are designed such that they can detect a radial force and/or a tangential force acting on a preferably straight-toothed gearwheel (4d), which connects the drive and the output of the flat output means (1) in a torque-transmitting manner, and provide same for the preferably electronic signal evaluation.
