Abstract (en)
A lid of a garbage container is provided, including: a main body (1), an opening and closing system (2) and a locking device (27). The main body (1) includes an input opening (11). The opening and closing system (2) is disposed on the main body (1) and includes a lid member (21) and a driving unit (24). The lid member (21) is disposed on the main body (1) and openably covers the input opening (11). The driving unit (24) drives the lid member (21) to move along a moving path (4) and uncover the input opening (11). The locking device (27) includes a blocking member (3) disposed on the main body (1). The blocking member (3) is configured to be externally operable and movable between a locking position and a releasing position. When the blocking member (3) is in the locking position, the blocking member (3) is on the moving path (4) and at least partially interferes with and blocks the lid member (21).
