Abstract (en)

[origin: WO2019228745A1] The invention relates to a method for monitoring an electrodynamic brake (1) in a rail vehicle. The invention also relates to a rail vehicle, in which such a monitoring is implemented. The invention proposes monitoring the electrodynamic brake (1) in a diverse and redundant manner. For this purpose, a second feedback channel (22) is proposed in order to detect a signal that is based on non-electrical, in particular mechanical, measured variables.
