Abstract (en)
[origin: US2019317549A1] A device for supporting an electronic display includes a base, a display mount, and a connection mechanism positioned between the base and the display mount. The display mount is movably connected to the base and movable between a first position and a second position. The connection mechanism is configured to couple a rotation of the display mount relative to base to a translation of the display mount relative to the base such that the display mount experiences rotation and translation when the display mount is moved between the first position and the second position.
