Abstract (en)

[origin: WO2020216889A1] The invention relates to a method for operating a data processing system, comprising: - providing at least two data computers, wherein both data computers are in data communication with one another or are able to establish this type of data communication with one another, - inputting operating parameters into at least one data computer in order to operate the data computers and/or in order to operate the data processing system, - addressing at least one data computer by the specific input of address data, - establishing an HTML-based communication connection between the data computers, wherein, following the establishment of the communication connection, data is transmitted from one data computer to at least one other data computer, wherein - the two data computers form a completely independent data system, which is preferably self-contained in terms of data, in such a way that the establishment of the communication connection and operation of the communication connection between the data computers is based solely on data communication between the data computers.
