Abstract (en)
[origin: WO2019202503A1] A ski boot (1) comprising: a substantially rigid foot-casing (2) which is adapted to accommodate the foot of the user; a substantially rigid cuff (3) which is adapted to enclose the lower part of the leg of the user, and pivotally joined to the foot-casing (2) so as to be able to rotate about a reference axis (A) substantially perpendicular to the midplane of the ski boot; and a manually-operated cuff locking device (15) which comprises: a support plate (16) placed on the cuff (3), above the heel of the ski boot (1); a movable arm (17) which is butt hinged onto the support plate (16) so as to be able to rotate to and from a locking position wherein the movable arm (17) extends downwards and couples in a releasable manner to the foot-casing (2) beneath; and an elastic counteracting member (18) which is adapted to bring and maintain, in an elastic manner, the movable arm (17) into said locking position; the head of the movable arm (17) being additionally fastened to the support plate (16) with the capability of sliding on the support plate (16) in a first direction (d) which is substantially parallel to the laying- and rotation- plane of the movable arm (17) and locally substantially tangent to the surface of the cuff (3); and the elastic counteracting member (18) being also adapted to counteract in an elastic manner the sliding of the movable arm (17) on the support plate (16).
