Abstract (en)
[origin: US2019314568A1] A medical device, such as a hemodialysis device or a peritoneal dialysis device includes a computation device, may be configured with an image-based support system, a method and/or a computer program for generating displayed instructional information for operation of the medical device. The computation device accesses a graphic memory on which instructional information is stored in a structured format having separately addressable sequences. An identification signal identifies individual sequences for dynamic display based on control data.
