Abstract (en)
[origin: GB2572996A] A plurality of patches (61, 62) (e.g. volumetric pixels, points of a point cloud or mesh) representing part of a volumetric scene are provided, along with patch visibility information for each patch indicative of directions from which a forward surface of the patch is visible. One or more viewing positions (60) associated with a client device (V) are provided, and the patch(es) are processed dependent on whether the patch visibility information indicates that the forward surface of the patch(es) is visible from the viewing position(s). If rear-facing (e.g. patch 61), a patch may not be rendered, or may not be transmitted to a client. Providing the patches may comprise estimating surface normals from points of a volumetric scene, and grouping together points having similar surface normals to provide a given patch. Metadata (e.g. SEI messages, manifest or descriptor of media content) indicative of the patch visibility may be transmitted to the client device.
