Abstract (en)
A cigar holder device is disclosed, and is applied for being an interface between a cigar and a user's mouth. When smoking a cigar, this cigar holder device is connected to a head end of the cigar. Therefore, after lighting a foot end of the cigar, a cigar smoke flows through a central through hole and a plurality of peripheral through holes contained by the cigar holder device, such that the user is able to inhale the cigar smoke under the separation of the cigar holder device. As a result, tobacco scraps are prevented from falling into the user's mouth during smoking the cigar, and the user's tongue would not feel uncomfortable. Therefore, by using this cigar holder device to smoke a cigar, the user is guaranteed to inhale cigar smoke at a comfortable state.
