Abstract (en)

The spacer object of this invention makes possible to retain a metal element of the framework of a slab without the need to carry out a conventional tying by wire or clipping, in a simple and fast way, it has a fixing element that performs this function at the same time once the assembly is fixed to the formwork board in a single operation, this also allows its use in inclined roofs, guaranteeing the correct position of the reinforcements while avoiding their buoyancy. The small contact surface with the formwork allows it to be used in exposed floors. Intended for the industrial construction sector.
