Abstract (en)

[origin: WO2019207094A1] In order to operate electrical devices (10, 11, 18, 20), amounts of power consumption of all the electrical devices (10, 11, 18, 20) are continually captured centrally, the amounts of power consumption are associated with the individual electrical devices (10, 11, 18, 20), and, in order to achieve at least one desired result, at least a first of the electrical devices (10, 11, 18, 20), the operation of which contributes to the achievement of the at least one of the desired results, and a second of the electrical devices (10, 11, 18, 20), the operation of which likewise contributes to the achievement of the at least one of the desired results, are operated with central coordination with each other. For this purpose, measurement values from a plurality of sensors (12, 13, 22) are centrally captured, the sensors (12, 13, 22) registering results that are achieved by the operation of the plurality of electrical devices (10, 11, 18, 20). Likewise centrally, correlations between changes in the measurement values of the individual sensors (12, 13, 22) over time and changes in the amounts of power consumption of the individual electrical devices (10, 11, 18, 20) over time are determined and the at least one desired result is selected from a sub-group of results that are registered by the sensors (12, 13, 22) and in the case of which the correlations between the changes in the measurement values of at least one of the individual sensors (12, 13, 22) over time and the changes in the amounts of power consumption of at least two of the individual electrical devices (10, 11, 18, 20) over time reach a first specified correlation minimum value.
