Abstract (en)

[origin: WO2019211462A1] The invention concerns a device and a method for the surface treatment of a material by a pressurised jet of liquid nitrogen or supercritical or hypercritical cryogenic nitrogen that may be loaded with particles. The device comprises: • - a mixing chamber (10) closed by a downstream wall in which an outlet hole is provided; and • - a focusing barrel (20) having an inlet opening and an outlet opening, the inlet opening of the barrel being designed to be attached to the mixing chamber (10), being in fluid contact with the outlet hole of the mixing chamber (10), the pressurised jet of nitrogen needing to pass through the focusing barrel from the inlet opening to the outlet opening. According to the invention, the focusing barrel is a diffusion focusing barrel (20) constituted by a hollow tube having three successive portions positioned one after the other, i.e.: - a convergent portion (21) situated at the side of the inlet opening of the diffusion focusing barrel and of which the inner surface, considered in the direction of flow of the nitrogen jet, is convergent, - a neck (22) of which the inner surface is cylindrical, and - a divergent portion (23) that ends at the outlet opening of the diffusion focusing barrel and of which the inner surface, considered in the direction of flow of the nitrogen jet, is divergent.
