Abstract (en)

[origin: WO2019217196A2] An electronic device with a touch-sensitive display displays a first user interface that is distinct from a home screen. The device detects a first input on a first edge of the display. In response, while the first contact continues to be detected on the first edge, the device, when the first input was detected on a first portion of the first edge and the first input meets dock- display criteria, displays a dock with a plurality of application icons at a first location along the first edge and, when the first input was detected on a second portion of the first edge that is distinct from the first portion and the first input meets the dock-display criteria, displays the dock at a second location along the first edge that is selected to include the second potion of the first edge, where the second location is different from the first location.
