Abstract (en)  
[origin: WO2019214894A1] The invention relates to a wall feedthrough comprising a frame which is divided into at least two chambers by at least one intermediate web. At least one socket made of an elastic material is arranged in each of the chambers, and the socket has at least one through-opening for receiving an elongated object which is to be guided through the wall. According to the invention, each two adjacent sockets with an intermediate web arranged therebetween are designed such that the sockets overlap the intermediate web in the longitudinal direction of the elongated objects over the entire height of a lateral edge of the socket on at least one side of the frame and sealingly contact each other.
