Abstract (en)

[origin: EP3792406A1] The invention relates to a movable device for joining a tool to a loading machine, said machine being provided with a set of blades for coupling said tool and with extendable and retractable securing bolts, and the rear portion of the tool being provided with respective housings for securing the blades, and with respective grooves arranged in respective projections for securing the bolts, wherein the housings are longer than the width of the blades, and it comprises a set of abutments movable along the housings between at least two positions that determine various positions for securing the blades of the loading machine; by means of which the length of the housings adapts to the width of the blades; and wherein the projections have a series of grooves corresponding to each of the positions for securing the blades in the housings as a function of the position of the abutments.
