Abstract (en)
[origin: EP3792423A1] In the window module (5) a lifting assembly (10) provides modulation of the movement of the sash (53) relative to the frame (51) when the sash (53) is swung out of the window module plane from a closed position to an open position and back. The lifting assembly (10) comprises a frame base plate (11) connected to the frame (51), a sash base plate (12) connected to the sash (53), a linkage mechanism including a main link (13) connected to the frame base plate (11) in a first hinged joint (131), and a sash link (14) connected to the sash base plate (12) in a sash-side hinged joint (141). The sash link (14) is connected to the main link (13) in a second hinged joint (132), and a spring device (15) having two ends is provided and connected at one end to the main link (13) in a third hinged joint (133) and at the other end (151) connected to the frame base plate (11) or the frame (51) of the window module (5) in a frame-side hinged joint (151).
