Abstract (en)
[origin: WO2019220541A1] Provided is a refrigeration cycle device having improved seasonal performance compared to a conventional refrigeration cycle device. The refrigeration cycle device (100) is equipped with a refrigerant circuit that includes a compressor (1), a first heat exchanger (3), and a second heat exchanger (4), and in which a refrigerant circulates. The refrigeration circuit is provided so as to be capable of switching between a first state, in which the first heat exchanger (3) acts as a condenser and the second heat exchanger (4) acts as an evaporator, and a second state, in which the second heat exchanger (4) acts as a condenser and the first heat exchanger (3) acts as an evaporator. The first heat exchanger (3) includes a first heat transfer tube (6) in the interior of which a refrigerant flows. The first heat transfer tube (6) has a first tube section (61) located downstream from an intermediate position in the direction in which the refrigerant circulates when the first heat exchanger is acting as a condenser. The first heat exchanger (3) also includes a first content member (7) arranged in the interior of the first tube section (61). The inner diameter D1 and the equivalent value diameter M1 of the first tube section (61) satisfy the relational expression $D1/2.5 < M1 < D1/1.5$ in the first state and the second state.
