Abstract (en)

[origin: WO2020134777A1] The present invention relates to the field of electrochemistry, and in particular to a positive electrode lithium supplementing material, and a manufacturing method therefor and use thereof. The present invention provides a positive electrode lithium supplementing material, comprising a first lithium-containing compound. The first lithium-containing compound is selected from a combination of one or more of compounds represented by formula I; an outer surface of the positive electrode lithium supplementing material comprises a second lithium-containing compound; the activity of a reaction between the second lithium-containing compound and water is lower than that between the first lithium-containing compound and water. The positive electrode lithium supplementing material provided by the present invention can effectively prevent a gelation phenomenon in a paste preparation process, further alleviate the inactivation of a lithium supplementing material caused by a reaction with water and carbon dioxide in the air in a pole piece storage process, improve the manufacturability of a lithium supplementing lithium ion battery to the greatest extent, and improve the energy density and electrochemical performance of the lithium ion battery.
