Abstract (en)

[origin: EP3798374A1] The present disclosure discloses a fixing device (B) for a faucet (A). The fixing device (B) comprises a base (1) and a pressing block mechanism (2). The pressing block mechanism (2) comprises two pressing plates (21), the two pressing plates (21) are respectively connected to a locking rod (31, 32), An inner side wall of the base (1) protrudes to define two connecting bases (11, 12). At least one of the locking rods (31, 32) is configured to move relative to the base (1) between a working state and a movable state. Movement of the at least one of the locking rods (31, 32) between the working state and the movable state cooperates with the change of the pressing block mechanism (2) between the unfolded state and the folded state. The change of the pressing block mechanism (2) drives the at least one locking rod (31, 32) to move, or the change of the pressing block mechanism (2) is driven by the movement of the at least one locking rod (31, 32). Therefore, the fixed device is convenient to assemble and disassemble.
