Abstract (en)  
An information processing device includes a memory that stores a known position of a marker, a camera, and a processor. The processor is configured to determine whether the image includes the marker, calculate a relative position of the marker with respect to the camera and store the calculated relative position in the memory if image includes the marker, and determine a position of the camera using the known position of the marker and two or more relative positions calculated for the marker stored in the memory.
