Abstract (en)  
A sound field model is easily reproduced from a 2D image data. An acoustic filter of an image data on an unknown space of which parameter is not known can be easily obtained. An acoustic device constituting a controller of an acoustic system includes a computation part (101), to which are connected an imaging device (2) mainly realized by a computer; a sound collector (3), and a storage device (4). The computation part (101) serves an encoder which makes an image of an unknown space associate with a spatial acoustic filter coefficient, so as to stereophonically reproduce a sound field. A decoder which can be a device separately from the acoustic device (100) is connected to a reproducer, in addition to the computation part (101). The reproducer outputs a sound corresponding to a 2D image with a reverberation sound obtained from a spatial acoustic filter characteristic corresponding to the image of the unknown space.
