Abstract (en)
[origin: WO2019228582A1] The invention relates to a drinking tube (1) consisting of two channels (2, 3) which when connected to one another and which form a closed cross section in which the edge regions (4) overlap, lie one on top of the other in a sealing manner or interlock with each other. The channels (2, 3) are each formed symmetrically with respect to a common axis of symmetry (5), wherein a) the height (h) of the channels (2, 3) in relation to the axis of symmetry (5) is smaller than the width (b) and/or b) the cross section of the inner channel (3) is equal to or slightly larger than the cross section of the outer channel (2), so that a tension exists between the channels (2, 3) lying one inside the other.
