Abstract (en)
[origin: WO2019228580A1] The invention relates to a plastic end profile for a lateral connection of a window sill to a wall surface to be plastered, wherein a base profile (4), which is L-shaped in the cross-section and laterally overlaps the window sill, has in each case a protruding plaster web (5-7) at the front and upper free edges. During the plastering of a window with a window frame and a window sill using such an end profile, a plaster strip (18) is connected in a seated manner on the window frame (12) on the plaster web (17) after the end profile (15) has been set with an upper plaster web (17) against the window frame (12), and a corner plaster strip (19), which is connected to the plaster strip (18), is placed on the front end of the plaster web (17).
